Condition: New. Publisher/Verlag: LAP Lambert Academic Publishing | How to avoid UV degradation of PVC | Poly(vinyl chloride) (PVC) is undoubtedly among the most frequently used plastics; it is widely applied in many branches of industry and building. When exposed to natural weathering, PVC deteriorates and becomes increasingly colored and brittle, with a steady decrease in mechanical properties such as tensile, elasticity, and impact resistance. Owing to its large outdoor application, PVC has to be protected against photodegradation. To prevent photodegradation reactions, there are several ways to stabilize the polymers. One can stabilize polymers by keeping the light out, quench excited states before photochemistry occurs, or trap free radicals. This can be achieved by adding UV absorbers, quenchers, radical scavengers, metal deactivators or synergistic combinations to the polymers. | Format: Paperback | Language/Sprache: english | 60 pp.
